Himanshu Singh

Data Analyst • himanshuds2025@gmail.com • +91 9318462693
github.com/himanshuds2025/Data-Analyst-Portfolio

SKILLS

Programming Languages:	SQL, Python (Pandas, Matplotlib)
Database Systems:	PostgreSQL, MySQL
Analysis & Visualisation Tools:	Excel (Pivot Tables, DAX, Lookups), Tableau, Power BI

PROFESSIONAL EXPERIENCE

InAmigos Foundation • Remote

Data Analyst Intern **Sept 2026 - Oct 2026**

- Assisted in research, collection, cleaning and organising of data.
- Facilitated the use of AI tools for researching prestigious NGOs to provide relevant reports.
- Delivered summary reports with data visualisation tools within respective deadlines.

PROJECTS

E-Commerce Churn Risk & Retention Analysis (End-To-End)

- Built an end-to-end PostgreSQL data warehouse (Star Schema, SCD Type-2, 100K orders) and automated ETL with 13 data quality checks.
- Engineered advanced SQL analytics (RFM segmentation, cohort retention, churn risk scoring) to identify delivery time as the primary churn driver - churned customers wait 12.7 days vs 6.6 days for active (2x longer) - giving logistics clear KPIs.
- Quantified retention gap: only 5.2% return after month 1, and below 1% from month 2.
- Delivered live Tableau dashboard and 2-page insights report with 4 data-backed, actionable recommendations, proving ability to translate data into business strategy.
- **Tools Used:** PostgreSQL, DBeaver, Excel, Tableau, Google Docs, Canva, Miro

California Hospital Labor Market & Workforce Risk Analysis (API)

- Extracted live hospital employment and wage data via BLS and QCEW APIs using Python, covering 6 years across 10 California counties.
- Identified Alameda County as the highest-risk labor market – 8% employment decline combined with 29.9% wage growth, signaling workforce erosion and cost pressure.
- Quantified critical disparities: 66% wage growth in Orange County vs 9.6% in San Joaquin, and 25% employment growth in San Francisco vs 8% decline in Alameda.
- Delivered an Insight Report pdf and Tableau dashboard for hospital administrators and policymakers.
- **Tools Used:** Python (Requests, Pandas, Matplotlib, Seaborn), Excel, Tableau

Iowa Corn Margin Stress Analysis (API)

- Pulled live county-level corn yield data from USDA API and integrated with ERS cost data to calculate per-acre profit margins for 82 Iowa counties.
- Quantified the losses and margin impacts, ranked counties by financial stress in EDA; as well as state-wide average loss is approximately -$127 per acre.
- Extended to 10-year time series tracking year-over-year margin changes to identify deteriorating vs. recovering counties.
- Bundled the analysis in an Insight Report pdf as a deliverable.
- **Tools Used:** Python (Requests, Pandas, Matplotlib, Folium)

EDUCATION

Bachelor Of Computer Application (BCA) **July 2024 - June 2027**
